

The Raptor™ Series DDRs

playbacktech.com

Overview

Playback Technologies continues to develop its line of affordable and feature rich digital disk recorders for film production video assist and other cost-sensitive applications. With more than 200 units now in use worldwide, the Raptor model 50VA has become the new standard for commercial video assist operators.

With an MSRP of \$3,499, the Raptor 50VA now comes with a removable 80GB hard drive to provide up to eight hours of record time in NTSC or PAL.

DC operation for go-anywhere use, and an RS-232 interface along with optional PC control software provide access to an advanced feature set including ramping, playlist editing and multi-camera support with instant sync playback.

The Raptor series DDRs offer user-adjustable compression settings, composite and Y/C video in and out along with two channels of unbalanced audio. Front panel cue points can be set during record or playback and are non-volatile during power down.

Feature film video assist users now have a cost-effective way to add more 'digital channels' to their single and multiple camera systems, and provide splinter and second units with a small, easy-to-use playback and scene reference tool. Camera rental houses now also have a solution for replacing their aging Video 8 combos.

Model 50VA Front Panel Features

VTR style jog/shuttle	Record time remaining
Slow motion	Clip search
Variable speed	4 cue points
Loop playback	Clip naming
VU meters	9-28vdc operation
